Abstract

Introduction: The terms “telemedicine” and “telehealth” are similar, yet carry different meanings and are often defined differently.

Methods: A decadal longitudinal study analyzing the usage of these terms in the *Telemedicine and e-Health Journal (TMJ)* between 2010-2020 was conducted. Looking at the keywords assigned to the “Original Research” papers, “telemedicine” (34%) is used almost 3 times more than telehealth (12%). Although “other” keywords are assigned at a similar frequency as “telemedicine.” A similar pattern is followed for the terms within the text.

Results: “Telemedicine” and “other” terms are used the most (36%), while papers using both (“telemedicine” and “telehealth”) (15%) or “telehealth” (14%) as terms throughout the paper are less. This longitudinal study also analyzed the *TMJ’s* editorial board between 2010-2020. Most of the board is made up of physicians (MD or DO) (42) or PhDs (33), with 25 out the 75 having dual credentialing.

Conclusion: Also, while there is international influence within the board (UK, India, France, Canada, etc.) most of the board is associated with an American organization (educational and/or corporate). Most of the board (34/75) has also been present between 10 and 11 years within the study period (a total of 11 years).

Keywords: telemedicine, telehealth, editorial board

Introduction

Word choice is incredibly powerful. Famed authors are intentional with their words in their works of literature. The academic world is no different. The choice between using “telemedicine” versus “telehealth” is a powerful one, especially now with a limelight shining on tele-services provided in healthcare due to the COVID-19 pandemic. A recent review of the terms on PubMed for the period January 2019 – December 2021, yielded 18,151 publications with the term ‘telemedicine’ and of ‘telehealth’, 20,342.

To further understand the distribution between the related terms “telemedicine” and “telehealth” in the last 11 years (2010-2020), specifically in the *Telemedicine and e-Health Journal (TMJ)*, this paper explores the number of times the terms “telemedicine,” “telehealth,” both, or neither were used in manuscripts published either as keywords or within the manuscript itself.

To better understand the TMJ’s perspective, this study also analyzed the journal’s editorial board during the same period, 2010-2020. This provided insight into the perspective of the journal. The editorial board’s credentialing, country affiliation, and years of service were explored.

Definitions

Often “telemedicine” is used interchangeably with “telehealth” since the connotations are similar, but both of these terms have very different annotations:

Telemedicine refers to a health care provider services (e.g., tele-nutrition, telepsychology, telepharmacy) provided at a distance via telecommunications and other technologies.¹

Telehealth refers to any health care-related service (including non-clinical such as administration, training, continuing medical education) provided at a distance via some sort of technology.¹

Which term is used by specific literature, organizations, and presentations is sometimes chosen without meticulous consideration, but there should be as each term has different implications. Large health care organizations such as Centers for Medicare & Medicaid Services (CMS), Department of Veterans Affairs, Indian Health Services, and private insurers like UnitedHealthcare and BlueCross BlueShield have varying definitions of each term. Though they tend to use telehealth over telemedicine for reimbursements because they also support ancillary health services. Their precise definitions are outlined in Table 1. The Federal Government alone has several definitions, solely base on legislative intent.^{2,3}

Furthermore, given telemedicine and telehealth's recent shift onto center stage due to the COVID-19 pandemic⁴, the frequency at which each term has been used gives insight into the specific health care changes and preferences (especially in policy) that are occurring. Each term's usage also indicates which way the intersection between health care and telecommunications is swaying. To gain specific insight on the usage of the terminology "telemedicine" and "telehealth," this paper examines the *TMJ* between 2010-2020 (11-year range).

Methods

The data for this paper is derived from the *TMJ*. It was established in 1995 by Mary Ann Liebert Publishing with Mark Goldberg as the initial editor, followed by Rashid Bashshur. In 2005, Ronald Merrell and Charles Doarn, became editors-in-chief. Doarn has been the sole editor-in-chief since 2020. The purpose of this journal was to be a peer-reviewed, scientific journal for cutting-edge telemedicine applications for achieving optimal patient care and research outcomes and to share this knowledge to enhance clinical practice and serve as foundational material for policy development.⁵

To better understand the perspective of TMJ, the data mined for this paper included an analysis of the board members. To obtain an accurate list, the editor-in-chief Mr. Doarn was contacted. He provided a list of board members and their affiliations. The data for the board member credentials, country affiliation, and service years was derived from that list for this paper.

Each edition of the journal includes many sections— “Editorials,” “Letter to the Editor,” “Original Research,” “Reviews,” etc. To better understand which terms are used in the papers the “Original Research” section was the focus. For each study within that section, it was run through the computer’s “find” function to highlight the terms “telemedicine,” “telehealth,” and any other “tele-” term to see if a different pattern could be found. If a clear majority between the terms is present in a paper, then for data purposes is it assigned as a “telemedicine”, “telehealth”, or “other” paper. If no, there is no clear majority than the paper is assigned as “other” or “both” depending on the specific distribution. For the keyword data, the numbers are derived from the list of key words assigned to each “Original Research” paper.

Once the data was compiled it was visualized using Microsoft Excel.

The Journal

Since the journal’s inception, the editorial board has been made up of physicians (MD and DO) along with other professionals from a variety of disciplines. *Figure 1* below visualizes the educational background of the board.

Analyzing the credentials of the *TMJ* editorial board depicted in *Figure 1*, most members have a physician (MD or DO) background, followed by PhD, then masters degrees. Twenty-five members of the board have dual degree qualifications,

The editorial board also includes telemedical and e-Health leaders from around the world as depicted in *Figure 2*. While the majority of the board (51/75, 68%) is affiliated with a U.S.-based

academic institution or organization, there is significant international representation. From its inception, the board has included representation from Argentina, Canada, Brazil, France, Germany, India, Italy, Japan, Norway, Pakistan, Romania, South Africa, South Korea, Sweden, Russia, and the United Kingdom.

Furthermore, a large portion of the editorial board (28/75, 37%) has been involved for the whole-time frame of this study (2010-2020, 11 years). And everyone on the board in this time frame has been involved longer than a year. *Figure 3* below quantifies this information.

Initially the journal only had 4 quarterly issues, and then it was shortly expanded to 6 issues a year, then 10 issues a year, and now it has 12 issues a year (monthly). The submissions for this journal have also skyrocketed in the last year, due to the increased interest and usage of telemedicine and telehealth as a result of the COVID-19 pandemic. According to Fairhealth, telehealth claim lines have increased 2,817% from December 2019 to December 2020.⁶ More recent reports from 2021, have shown that telehealth usage has stabilized at levels 38 times higher than pre-pandemic times.⁷

Terminology

A total of 1,783 papers were published in the *TMJ* between 2010-2020. Of the 1,783 papers, 1,505 (84%) had keywords assigned to them. 16% did not, particularly older articles published closer to the year 2010.

This study only analyzed the 1,195 “Original Research” papers (which had keywords assigned to them) between 2010-2020. *Figure 4* below depicts the distribution of keywords assigned to these papers.

The “other” key terms used most often include mobile health (m-health), e-Health, and some sort of tele-specialty. Other frequently use terms include technology, patient portals, or distance education.

Looking through all the papers analyzed, 36% use “telemedicine”, 14% use “telehealth,” 15% use both, and 36% use other terms in the passage text to refer to a type of long-distance healthcare service or related topic. (*Figure 5*)

Conclusion

As telemedicine and telehealth become more mainstream, understanding their different definitions becomes more important. The word “telemedicine” does not encompass everything that the healthcare field is. And the word “telehealth” often doesn’t provide the specificity needed in building infrastructure for “care at a distance.” Looking back at the *TMJ*, we can see the deliberate choices made between those words, and how those choice have shapen the field. Combing through the vocabulary of the journal, multiple facets of the field come to light, from m-health to tele-cardiology.

Author Contribution

The concept of this paper was derived by Ms. Sodhi and Dr. Weinstein, who both discussed this concept and analysis with Mr. Doarn. Data analysis and writing was conducted by Ms. Sodhi and reviewed by Ms. Stewart. All authors participated in the final writing and editing of the manuscript.

Conflict of Interest

The authors report not conflicts of interest.

Funding

No funding was provided for this effort.

Acknowledgement

The authors acknowledge the guidance provided to Nandini Sodhi, a research fellow and medical student at the University of Arizona from Dr. Ronald Weinstein. Dr. Weinstein worked closely with Ms. Sodhi and the other authors in completing this work. The authors extend their thanks and appreciation to Ms. Nancy Rowe for her help in preparation all of the figures.

Table 1. The definitions of Telehealth according to several health organizations.

Organization	Definition of Telehealth
CMS (Medicare)	“Telehealth, telemedicine, and related terms generally refer to the exchange of medical information from one site to another through electronic communication to improve a patient’s health.” ⁸
CMS (Medicaid)	“For purposes of Medicaid, telemedicine seeks to improve a patient's health by <i>permitting two-way, real time interactive communication between the patient, and the physician or practitioner at the distant site</i> . This electronic communication means the use of interactive telecommunications equipment that includes, at a minimum, audio and video equipment.” ^{9**} <i>(Italics Added)</i>
Department of Veterans Affairs	“Telehealth uses technology and data to improve the way VA provides patient-centered care to Veterans.” ¹⁰
Indian Health Services	“Telehealth — sometimes called telemedicine — is the use of electronic information and telecommunication technologies to provide care when you and <i>the doctor are not in the same place at the same time</i> . If you have a phone or a device with internet access, you already have everything you need to get medical care or services through telehealth — you may be able to: <ul style="list-style-type: none"> • Talk to your doctor live over the phone or video chat. • Send and receive messages from your doctor using chat messaging, email, secure messaging, and secure file exchange. • Use remote patient monitoring so your doctor can check on you at home. For example, you might use a device to gather ECG or other vitals to help your doctor stay informed on your progress.”¹¹ <i>(Italics Added)</i>
Bluecross Blueshield (Private Insurer)	“The trend has been dubbed telehealth, and is allowing consumers to conveniently and affordably access quality health care through video conversations with board-certified physicians. <i>While telemedicine has been around for many years and has typically been used to connect rural patients to specialists</i> , improving their access to quality care, the technology is evolving and now telehealth can also be used to connect people (regardless of their location) to various types of clinicians—not just specialists—who have the ability to diagnose, treat and guide patient care.” ¹² <i>(Italics Added)</i>
United Healthcare (Private Insurer)	“Telehealth is medical care that’s delivered using technology platforms rather than in-person visits. It’s used to help with diagnosis, interventions and ongoing care management. At UnitedHealthcare, telehealth includes but is not limited to: Health care services delivered to individuals by care providers using interactive audio and visual technology.” ¹³

** CMS does have a page on “Telehealth,” but they use the term interchangeably with “Telemedicine.” CMS uses the term “Telehealth” in all of its Physician Fee Schedules, Interim Final Rules, etc. How CMS reimburses for telehealth is determined by two things: The Social Security Act, Section 1834(m) and CMS’ own regulatory authority. CMS can add codes to its list of approved “Telehealth services.”

NOTE: CMS does not consider certain services (remote physiologic monitoring, eVisits, or Communication Technology-Based Services) to be “Telehealth”—those are all covered, but with different rules. Each state defines it differently and reimburses for it differently—it’s up to the states.
